

# AquaSpoiler

The ultimate leading edge

## Before AquaSpoiler:

- Debris getting caught
- Mouldy
- Tatty looking
- Tangled pulling ropes
- Press fix connectors popping off

## With AquaSpoiler:

- Totally encapsulated
- Easy to clean
- Robust and strong
- One detachable control pulling point
- New screw together SmartClic connections
- Reuseable on future solar covers, so excellent value for money

AquaSpoiler is extruded using ABS material (with extra UV stabiliser) which makes it strong, light and bouyant. It won't get mouldy and unsightly debris won't get trapped inside any part. The different component parts all snap together to make a very rigid boom. This will all be done in the factory as well as pre-drilling the holes to connect AquaSpoiler to the cover.

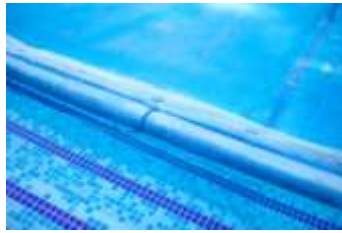

To connect the AquaSpoiler to the solar cover the revolutionary new connector SmartClic is used. These screw tightly together which means they won't just pop off.

AquaSpoiler is so strong that it won't need a 3-point rope attachment. We use just one central pulling point using a marine standard D-hook in the centre of each boom with a detachable rope which can then be coiled up and safely stored away.

---

After a couple of seasons, an ordinary leading edge can end up looking like this or even worse.

---

An AquaSpoyer leading edge will get chemical deposits too, but unlike the other types of leading edge, it can be easily cleaned off.

Initially it may be more expensive, but because SmartClics unscrew, it means the AquaSpoyer can be easily detached from the old cover and attached to the new cover.

All this means that AquaSpoyer represents good value for money to the end-user.
